BINAYAK DOTEL

Software Engineer · Backend, APIs and Systems Integration
Bhaktapur, Nepal | +977 9763694367 | binayakdotel01@gmail.com | github.com/BinayakDotel

PROFILE

Software engineer with 4+ years of full-time professional experience (2022–2026) building and maintaining production backend services, APIs and integrations for US clients, after two earlier years shipping mobile games. Works from approved requirements: implements features and APIs, writes automated tests, investigates and fixes defects, takes part in code review through pull requests, and documents what was built. Has worked in privacy-sensitive, regulated settings (California CCPA, insurance policy and claims records) where every result must be traceable, testable and safe to hand over. B.E. Software Engineering, CGPA 3.9/4.0, Faculty Topper.

SKILLS

API Development	REST APIs, webhooks, FastAPI, Node.js, Bun, TypeScript; asynchronous API wrappers; validated, structured request and response formats.
Programming	Python, TypeScript, JavaScript, SQL, C#, C++, GDScript.
Integration	Slack, Linear and GitHub integrations; MCP tool servers; Anthropic and OpenAI APIs; third-party video-generation services (Veo 3, Seedance, Wan via ComfyUI); Firebase.
Unit & Integration Testing	Labelled test sets, regression runs on every change, test-first development, automated scoring of system output.
Debugging	Tracing failures through event logs and decision logs; supervising long-running jobs; stopping stuck runs; reproducing and explaining results afterwards.
Git & Delivery	Git and GitHub, branch-per-task and stacked pull requests, code review, Docker, CI/CD, prompt and model version control.
Databases & Frontend	PostgreSQL, SQL, Convex; React, Next.js, Tailwind CSS.

EDUCATION

B.E. Software Engineering — Nepal College of Information Technology

2017 – 2022

- CGPA 3.9 / 4.0, Faculty Topper.
- NEXT Hackathon, 1st runner-up (augmented reality for education).
- Final-year project: SRGAN image super-resolution.

PROFESSIONAL EXPERIENCE

Senior Software Engineer (Remote) — WhiteHat Engineering (formerly Earth9 Inc.)

2022 – 2026

US-based company, worked remotely from Nepal. Joined as a game developer; the company moved into AI filmmaking, then took on external client engagements.

Client engagement: US insurance technology company (AI voice lead qualification)

- Built an automated call-review service for an AI voice agent that screens insurance leads. It scores every call on lead validity (qualified, wrong person, dead air), agent behaviour and call quality, replacing manual spot checks.
- Implemented California Consumer Privacy Act (CCPA) handling so that requests to delete data, or to stop it being sold or shared, were honoured across the system.
- Built multi-step workflows and document question-answering (RAG) over policy and claims records: structured extraction, a source cited on every answer, state kept outside the model, hard iteration caps, and escalation to a person when a record was incomplete.
- Owned testing of AI output: labelled test sets, regression runs on every change, prompt and model versioning, and decision logs so any result could be reproduced and explained.

Client engagement: Stoke (agent infrastructure)

- Built infrastructure that runs many automated Claude Code agents unattended. Tasks arrive from Slack or Linear; each runs in its own git worktree and branch, opens a pull request and reports progress back to the thread that started it.

- Integrated Slack, Linear, GitHub and MCP tool servers through APIs and webhooks. Added supervision that stops stuck runs, and a Convex-backed live dashboard and command-line tool for watching, debugging and steering concurrent runs.

ACT 3 generative film platform

- Built the prompt-to-film pipeline: an LLM expands one prompt into a shot list, each shot is generated through external video services (Veo 3, Seedance, Wan via ComfyUI) using custom asynchronous API wrappers, and the shots are assembled into a film. The platform cuts 80–200 hours of pre-production to about two.

Real-time 3D tools

- Built an internal level editor that let non-technical staff create complex environments without engineers, plus procedural terrain from real-world coordinates and OpenStreetMap data and a 2D-to-3D building pipeline.

Unity Game Developer (Freelance) — Aastav, Nepal

2020 – 2022

- Shipped and maintained several published mobile games end to end: custom UI, Firebase backend, in-app purchases and ad monetization.

PROJECTS

Dekko (2026) — AI pull-request comprehension tool

- Helps reviewers understand a pull request: a typed change model with line-level citations, a deterministic diagram renderer and an automated answer grader. Built in two days with an agent-driven ticket workflow: 87 commits, test-first, stacked PRs. TypeScript, Next.js, Convex, Claude.
  github.com/BinayakDotel/dekko-monorepo

Skills Marketplace

- Agent Skills (SKILL.md files) for Claude and other AI agents, published as an open repository. Python.
  github.com/BinayakDotel/skills-marketplace

Mero Pasal

- Phone-first progressive web app (PWA) that turns a Kathmandu kirana shop’s paper bills into a searchable digital bill book. TypeScript.
  github.com/BinayakDotel/mero-pasal

Chroma Rush

- Colour-matching endless runner built in Godot 4 (GDScript). Submitted to the CrazyGames portal; used its player metrics (playtime, return rate) to ship an update with an easier first minute.
  github.com/BinayakDotel/chroma-rush
